Worksheet B: Belief, Alief and Your Own Doubt

Name: _____ Date: _____

Task 3: Belief or alief?

homework

A *belief* is a conscious conviction that can be changed by arguments; an *alief* is an automatic, bodily readiness to react that keeps running alongside it. Give two examples from your own life in which what you know and what you experience come apart (example: you know that a glass bridge will hold you, and still you do not dare to step onto it). Which procedure could help you follow your knowledge rather than your experience?

Task 4: Short essay

homework, 500 words, due by Unit 2

"Describe an experience that made you doubt a conviction for the first time. What does this have to do with science?" Use at least two of the key terms of this unit (prediction error, predictive processing, belief, alief, ideomotor effect).

Task 5: Preparing for Unit 2

homework

Bring a question that *really* occupies you – from your studies, work or everyday life. In Unit 2 it will be sharpened into a research question.
